Abstract: In this paper, the author has formulated the solutions of a special standard cubic congruence of composite modulus modulo a special multiple of square of an odd prime. The effort for the formulation is presented here. This cubic congruence has exactly \( p \) incongruent solutions, where \( p \) is an odd prime present in the congruence. The formula is tested and verified true. Several numerical examples are solved here. The solutions are obtained using the established formula. No Need to use Chinese Remainder Theorem (CRT). Formulation is the merit of the paper.

Keywords: Cubic congruence, cubic residues, Chinese Remainder Theorem (CRT), Odd primes, Formulation.

INTRODUCTION

A standard cubic congruence of the type: \( x^3 \equiv b \pmod{m} \), has different number of solutions depending upon the modulus \( m \). If \( b \equiv a^3 \pmod{m} \), then \( b \) is called cubic residue of \( m \), \( a \) being the residue of \( m \) and the congruence reduces to \( x^3 \equiv a^3 \pmod{m} \) and is always solvable [1].

Here the author considered a standard cubic congruence of special composite modulus having \( p \)-incongruent solutions where \( p \) is an odd prime present in the congruence.

PROBLEM-STATEMENT

Here the problem is “To formulate the solutions of the standard cubic congruence:

1. \( x^3 \equiv p^3 \pmod{p^2}; p \) odd prime.
2. \( x^3 \equiv p^3 \pmod{p^2.q}; p, q \) being different odd primes."
3. \( x^3 \equiv p^3 \pmod{p^2.3^n}; p \) odd prime and \( n \) is any positive integer.

LITERATURE REVIEW

It is seen that cubic congruence are not studied in universities. Most of the Number Theory syllabus contains linear and quadratic congruence of prime modulus [1], [2], [3]. So no discussion is found in the literature of mathematics. But Zukerman [3], Koshy [2] had taken a bold attempt to define a congruence and cubic residues. But online searching provides many research formulations of the author only on cubic congruence of composite modulus [4], [5], [6], [7].

ANALYSIS & RESULTS

Case-I: Consider the congruence: \( x^3 \equiv p^3 \pmod{p^2} \), \( o \) being an odd prime.

For the solutions, consider \( x \equiv pk + p \pmod{p^2} \). Then,

\[
\begin{align*}
    x^3 & \equiv (pk + p)^3 \pmod{p^2} \\
    & \equiv p^3k^3 + 3p^2k^2p + 3pkp^2 + p^3 \pmod{p^2} \\
    & \equiv p^3k(k^2 + 3k + 3) + p^3 \pmod{p^2} \\
    & \equiv p^3 \pmod{p^2} 
\end{align*}
\]

So, \( x \equiv pk + p \pmod{p^2} \) satisfies the congruence and hence gives all the solutions for different \( k \).

But \(fork = p\), the solutions formula reduces to \( x \equiv p^2 + p \pmod{p^2} \)

\[
\begin{align*}
    & \equiv p^2 + p \pmod{p^2} \\
    & \equiv 0 + p \pmod{p^2}.
\end{align*}
\]

This is the same solution as for \( k = 0 \).

Also, for \( k = p + 1 \), similarly it is seen that the solution formula reduces to

\[
\begin{align*}
    x & \equiv p^2 + p + p \pmod{p^2} \\
    & \equiv p + p \pmod{p^2}.
\end{align*}
\]

This is the same solution as for \( k = 1 \).

Therefore, all the solutions are given by \( x \equiv pk + p \pmod{p^2} k, k = 0, 1, 2, ..., (p - 1) \).

Case-II:

Consider the congruence: \( x^3 \equiv p^3 \pmod{p^2.q}; p, q \) being different odd prime.

For solutions, let \( x \equiv pqk + p \pmod{p^2q} \).
Then, \( x^3 \equiv (pqk + p)^3 \pmod{p^2q} \)
\[ \equiv p^3q^3k^3 + 3.p^2q^2k^2.p + 3.pqk.p^2 + p^3 \pmod{p^2q} \]
\[ \equiv p^3k(k^2 + 3k + 3) + p^3 \pmod{p^2q} \]
So, \( x \equiv pqk + p \pmod{p^2q} \) satisfies the congruence and hence gives all the solutions for different \( k \).

But for \( k = pq \), the solutions formula reduces to \( x \equiv p, p + p \pmod{p^2q} \)
\[ \equiv p^2 + p \pmod{p^2q} \]
\[ \equiv 0 + p \pmod{p^2q} \].

This is the same solution as for \( k = 0 \).

Also, for \( k = pq + 1 \), similarly it is seen that the solution formula reduces to
\[ x \equiv p, pq + pq + p \pmod{p^2q} \]
\[ \equiv p^2q + pq + p \pmod{p^2q} \]
\[ \equiv pq + p \pmod{p^2q} \].

This is the same solution as for \( k = 1 \).

Therefore, all the solutions are given by \( x \equiv pqk + p \pmod{p^2q}k \),
\[ k = 0, 1, 2, \ldots, (p - 1). \]

**Case-III:**

Consider the congruence:
\[ x^3 \equiv p^3 \pmod{3^n.p^2}; p \text{ being odd odd prime, n any positive integer}. \]
For solutions, let \( x \equiv 3^{n-1}.pk + p \pmod{3^n.p^2} \).
Then, it is also seen that the solutions formula: \( x \equiv 3^{n-1}pk + p \pmod{3^n.p^2} \) satisfies the congruence and hence gives all the solutions for different \( k \).

But for \( k = 3p \), the solutions formula reduces to \( x \equiv 0 + p \pmod{3^n.p^2} \).
This is the same solution as for \( k = 0 \). Similarly, it is seen that the solution formula reduces to \( x \equiv 3^{n-1}pk + p \pmod{3^n.p^2} \) for \( k = 3p + 1 \).
This is the same solution as for \( k = 1 \).

Therefore, all the solutions are given by \( x \equiv 3^{n-1}pk + p \pmod{3^n.p^2}k \),
\[ k = 0, 1, 2, \ldots, (3p - 1). \]

**ILLUSTRATIONS**

**Example-1:** Consider the congruence \( x^3 \equiv 125 \pmod{25} \).
It can be written as \( x^3 \equiv 5^3 \pmod{5^2} \)
It is of the type: \( x^3 \equiv p^3 \pmod{p^2} \).
It has exactly \( p=5 \) solutions.
The solutions are given by
\[ x \equiv pk + p \pmod{p^2}; k = 0, 1, 2, \ldots, (p - 1). \]
\[ \equiv 5k + 5 \pmod{5^2}; k = 0, 1, 2, \ldots, 5 - 1 \]
\[ \equiv 5k + 5 \pmod{25}; k = 0, 1, 2, \ldots, 4. \]
\[ \equiv 5, 10, 15, 20, 25 \pmod{25}. \]

**Example-2:** Consider the congruence \( x^3 \equiv 343 \pmod{539} \).
It can be written as: \( x^3 \equiv 7^3 \pmod{7^2.11} \) with \( p = 7, q = 11, n = 2 \).
It is of the type: \( x^3 \equiv p^3 \pmod{p^2.q} \).
The solutions are given by
\[ x \equiv pqk + p \pmod{p^2q}; k = 0, 1, 2, \ldots, (p - 1). \]
\[ \equiv 7.11k + 7 \pmod{7^2.11}; k = 0, 1, 2, \ldots, p - 1 \]
\[ \equiv 7.11k + 7 \pmod{7^2.11}; k = 0, 1, 2, \ldots, (7 - 1) \]
\[ \equiv 77k + 7 \pmod{539}; k = 0, 1, 2, \ldots, 6. \]
\[ \equiv 7, 84, 161, 238, 315, 392, 469 \pmod{539}. \]
These are the \( p = 7 \) solutions of the congruence.

**Example-3:** Consider the congruence \( x^3 \equiv 125 \pmod{325} \).
It can be written as: \( x^3 \equiv 5^3 \pmod{5^2.13} \) with \( p = 5, q = 13 \).
It is of the type: \( x^3 \equiv p^3 \pmod{p^2.q} \).
The solutions are given by
\[ x \equiv pqk + p \pmod{p^2q}; k = 0, 1, 2, \ldots, (p - 1). \]
\[ \equiv 5.13k + 5 \pmod{5^2.13}; k = 0, 1, 2, \ldots, (5 - 1) \]
\[ \equiv 65k + 5 \pmod{325}; k = 0, 1, 2, 3, 4. \]
\[ \equiv 5, 70, 135, 200, 265 \pmod{325}. \]
These are the \( p = 5 \) solutions of the congruence.

**Example-4:** Consider the congruence \( x^3 \equiv 1331 \pmod{1573} \).
It can be written as: \( x^3 \equiv 11^3 \pmod{11^2.13} \) with \( p = 11, q = 13 \).
It is of the type: \( x^3 \equiv p^3 \pmod{p^2.q} \).
The solutions are given by
\[ x \equiv p q k + p \ (mod \ p^2 q) ; k = 0, 1, 2, \ldots \ldots , (p - 1) .
\]
\[ \equiv 11.13k + 11 \ (mod \ 11^2.13) ; k = 0, 1, 2, \ldots \ldots , (11 - 1) \]
\[ \equiv 143k + 11 \ (mod \ 1573) ; k = 0, 1, 2, 3, \ldots \ldots \ldots \ldots \ldots \ldots , 10. \]
\[ \equiv 11, 154, 297, 440, 583, 726, 869, 1012, 1155, 1298, 1441 \ (mod \ 1573) . \]

These are the \( p = 11 \) solutions of the congruence.

**Example-5:** Consider the congruence \( x^3 \equiv 1331 \ (mod \ 1089) \).

It can be written as: \( x^3 \equiv 11^3 \ (mod \ 3^2.11^2) \) with \( p = 11 \).

It is of the type: \( x^3 \equiv p^3 \ (mod \ 3^n.p^2) \).

The solutions are given by

\[ x \equiv 3^{n-1}p k + p \ (mod \ 3^n.p^2) ; k = 0, 1, 2, \ldots \ldots , (3p - 1) . \]
\[ \equiv 3.11k + 11 \ (mod \ 11^2.13) ; k = 0, 1, 2, \ldots \ldots , (11 - 1) \]
\[ \equiv 33k + 11 \ (mod \ 1089) ; k = 0, 1, 2, 3, \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots , 32. \]
\[ \equiv 11, 154, 297, 440, 583, 726, 869, 1012, 1155, 1298, 1441 \ (mod \ 1089) . \]

These are the \( 3p = 3.11 = 33 \) solutions of the congruence.

**CONCLUSION**

Therefore, it is concluded that the standard cubic congruence: \( x^3 \equiv p^3 \ (mod \ p^2) \), \( p \) being different odd prime, has exactly \( p \) incongruent solutions given by

\[ x \equiv p k + p \ (mod \ p^2) , k = 0, 1, 2, 3, \ldots \ldots , p - 1 . \]

Also the congruence: \( x^3 \equiv p^3 \ (mod \ p^q) , p, q \) being different odd primes, has exactly \( p \) incongruent solutions given by

\[ x \equiv p q k + p \ (mod \ p^2 q) ; k = 0, 1, 2, 3, \ldots \ldots , p - 1 . \]

Also the congruence: \( x^3 \equiv p^3 \ (mod \ 3^p p^2) , p \) being odd prime, has exactly \( 3p \) incongruent solutions given by

\[ x \equiv 3^{p-1}p k + p \ (mod \ 3^p.p^2) , k = 0, 1, 2, 3, \ldots \ldots , 3p - 1 . \]

**MERIT OF THE PAPER**

The established formula is tested and verified true solving some suitable numerical examples.

Oral calculation for solutions is also become possible. It made the study of the cubic congruence very simple and interesting. It is time saving. This is the merit of the paper.
